21. By 2050, the world's population is projected to rise to 9 billion from just over 7 billion currently. Proponents of genetically modified foods say they are safe and can boost harvests even in bad conditions by protecting against pests, weeds and drought. This, they argue, will be essential to meeting the needs of a booming population in decades to come and avoiding starvation.

However, Doug Gurian-Sherman, senior scientist for the food and environment program at the Union of Concerned Scientists, an advocacy group, said genetic engineering for insect resistance has provided only a modest increase in yields since the 1990s and drought-resistant strains have only modestly reduced losses from drought.

Moreover, he said conventional crossbreeding or cross-pollinating of different varieties for desirable traits, along with improved farming, is getting better results, boosting yields at a lower cost. In fact, much of the food Americans eat has been genetically modified by those conventional methods over thousands of years, before genetic engineering came into practice.

“Overall, genetic engineering does not get nearly the bang for the buck as conventional breeding and improve agricultural practices,” Gurian-Sherman said. His organization advises caution on GM foods and favors labeling, though it acknowledges the risks of genetic engineering have sometimes been exaggerated.

Andrea Roberto Sonnino, chief of research at the U.N. food agency, said total food production at present is enough to feed the entire global population. The problem is uneven distribution, leaving 870 million suffering from hunger. He said world food production will need to increase by 60 percent to meet the demands of 9 billion by 2050. This must be achieved by increasing yields, he added, because there is little room to expand cultivated land used for agriculture.

Genetically modified foods, in some instances, can help if the individual product has been assessed as safe, he said.

“It's an opportunity that we cannot just miss.”

22. Something else could be coming soon to a vehicle near you: more technology, the kind that could help your car talk to others around it. Unlike some proposed cars of the future, it would not actually do the driving for you. But it could warn you about what other drivers are doing. The U.S. government may require this feature in the future, but it would add to the cost of the car.

Vehicles of the future could be cars that talk to the driver and each other. The U.S. government wants them on the road soon, pushing for technology that would warn drivers of danger coming from any direction.

It’ s called vehicle-to-vehicle technology. Cars would send wireless messages to each other within about 300 yards, communicating information like speed, direction and GPS position ten times per second. When cars share this information, they can account for all the vehicles around them, which means they are able to identify possible crashes.

The technology sees around corners, over hills and through other vehicles. For example, my car will tell me that there are five cars just ahead of me, and I can slow down beforehand while the vehicle ahead sends my car a message giving me enough time to react.

33,000 Americans are killed and 2.3 million injured in car crashes every year. The Department of Transportation (DoT) predicts, talking cars could prevent up to 80 percent of crashes involving sober drivers.

Five major car companies have been working with DoT on developing and testing the technology. 3,000 cars are already using it as part of a government pilot test. Sometime after 2016, the U.S. government hopes your car will be able to communicate with you.

While DoT hopes to make this technology the rule by 2016, it will still need the public to weigh in before anything is finalized. Now, as for privacy, the government says that data sent between cars doesn’ t record personal information, so your privacy should not be compromised.

23. There is no denying that students should learn something about how computers work.For people should have some basic idea of how the things that they use do what they do. Further, students might be helped by a course that considers the computer's impact on society.Computer literacy is not a form of literacy (读写能力); it is a trade skill.

Learning how to use a computer and learning how to program one are two distinct activities. The competent citizens of tomorrow should free themselves from their fear of computers. But this is quite different from saying that all ought to know how to program one. Leave that to people who have chosen programming as a career. While programming can be lots of fun, and while our society needs some people who are experts at it, the same is true of auto repair and violin-making.

Learning how to use a computer is not difficult, and it gets easier as programs become more “user-friendly” . Let us assume that in the future everyone is going to have to know how to use a computer to be a competent citizen. What does the phrase “learning to use a computer” mean? It sounds like “learning to drive a car” , that is, it sounds as if there is some set of definite skills that, once acquired, enable one to use a computer.

In fact, “learning to use a computer” is much more like “learning to play a game” , but learning the rules of one game may not help you play a second game, whose rules may not be the same. There is no such a thing as teaching someone how to use a computer. One can only teach people to use this or that program and generally that is easily accomplished.

综合题 (20.0 分)

(1) To be the competent citizens of tomorrow, people should understand that programming a computer is more essential than repairing a car.
